Amendments to the Specification:

Please replace the two paragraphs on page 3, lines 10-16 with the following new paragraph:

In accordance with aspects of the present invention, there is provided an arrangement and a method for impermanent connectivity between a client unit and a server in a network. The arrangement includes, at the client unit, a client proxy for receiving information to be sent to the server and for which a server response is to be received from the server, for storing the information, and for sending a substitute response for the server response; and relaying means for relaying the information from the client proxy at the client unit to the server responsive to a connectivity link between the client unit and the server being established.
